

METHOD AND SYSTEM FOR  
TRAINING TRADERS

Background of the Invention

- 5 [0001] The present invention relates to a method and system for training traders. More particularly, the present invention relates to a method and system that that provides students the opportunity to gain valuable skills and experience in trading financial products.
- 10 [0002] The advent of high-speed networking technologies and the widespread adoption of trading platforms via personal computers, the Internet, wireless and handheld devices, etc., have brought about rapid change and development of the trading function in
- 15 professional financial services institutions. Such changes include automation of back office operations (i.e. order processing, trade-clearing, etc.) and the creation of new financial instruments made possible with the increased capacity of robust mainframe and
- 20 supercomputing information systems that model enormous amounts of data.
- [0003] This widespread utilization of technology has caused traders to place a greater emphasis on strategic decision making, implementing such strategic changes
- 25 substantially instantaneously from the terminal of a

trading desk. Technology has become a fundamental component of the trading profession, and the ability of traders to leverage technology in obtaining, analyzing, synthesizing and reacting to a vast amount of information from a variety of sources is an important cornerstone of a trader's success.

[0004] Accordingly, the trading function at any financial institution requires a refined balance of technical know-how and real-world experience that can only be gained through active participation in a market-based financial exchange. While a formalized education might convey the requisite financial and technical skills needed to perform on the job, this method of education does not lend itself toward the latter task of gaining an intimate knowledge of market behavior and a polished acumen for financial transactions. This expertise is essential to the success of any trader and can only be gained through direct experience.

[0005] Known systems and methods for training financial traders traditionally include one in which knowledge is passed down directly from one generation of traders to the next through apprenticeships and in-house training programs at brokerage houses, brokers, dealers, broker-dealers and other financial services institutions. Through this method of apprenticeship and direct observation, aspiring traders are able to integrate the experience and expertise of veteran brokers into their own professional practices. This requirement is inconvenient and inefficient, however, in that it requires the presence of a licensed professional trader and, in most cases, individualized attention - resources

10015739.121201

unavailable in a traditional university learning environment.

Summary of the Invention

[0006] It is therefore an object of the present  
5 invention to provide a system and method for training  
students in the art of trading financial products via an  
electronically simulated trading environment that enables  
students to trade simulated financial products -- i.e.,  
financial products that have no intrinsic value and,  
10 therefore, that have no real-world financial risk --  
within the simulated market.

[0007] It is also an object of the present invention  
to provide a system and method of training traders  
through which students actively exchange simulated  
15 financial products in a simulated market that responds  
to, and requires action from, participating students.

[0008] It is also an object of the present invention  
to provide a system and method through which students,  
using a graphical user interface (GUI), would be able to  
20 trade products with no intrinsic value but whose value  
was determined by participation in the simulated market.

[0009] It is also an object of the present invention  
to provide a system and method that teaches important  
trading skills to students such as how to obtain, analyze  
25 and synthesize critical financial information, react to  
abrupt changes in market conditions, read and react to  
market behavior and dynamics, and the perspective with  
which one must become familiar when participating in a  
dynamic marketplace.

30 [0010] It is further an object of the present  
invention to present a GUI that enables participants to

FOOTNOTES

receive real-time pricing information (i.e., bid and ask quotes), news stories, SEC filings, etc. The GUI may also provide participants an opportunity to trade directly with other participants in real-time within the  
5 same system.

[0011] These and other objects of the present invention are achieved by preferably providing rules-based systems and methods to create a simulated financial exchange that may teach students how to trade financial  
10 products. The system may contain fixed pre-programmed rules that emulate real markets. Participants may also create their own rules or adjust existing ones to customize the simulated exchange to meet their particular needs. The system may operate on any combination of  
15 Local Area Network (LAN), Wide Area Network (WAN), Virtual Private Network (VPN), wireless network, or any available means of communicating information among more than one computing device. The system may relate real-time information between the system and the simulation's  
20 participants. Participants may access the system with personal computing devices (PCs), Personal Digital Assistants (PDAs), or any networked computing device via the Internet, a self contained server network, or any means of connecting participating computing devices.

25 [0012] The simulation preferably requires at least one participant and each participant should preferably be registered to participate in the simulation. Each participant may receive an account upon their registration. Participants should not trade real  
30 financial products that maintain real financial risk. Rather, the products traded may be simulated financial products that assume the benefits of similar products

10015739.121201

traded in real markets. Or, the products traded may be real products, but the trades may be fictional and not actually executed.

[0013] The implemented method may consist of some  
5 method of payment, either a flat participation rate or a fee-per-trade pricing mechanism. All registration fees may be furnished by the participating educational institution(s), corporate sponsor(s), or other source. The registration fees may be pooled to form a winner's  
10 jackpot. At the conclusion of the simulation the participant(s) with the highest account value may be awarded an amount from the jackpot to be pre-specified by the participants, or administrators, of the closed trading simulation. This amount could be a fixed sum,  
15 some percentage of the total per trade fee generated by the participant(s), or any method of measuring and rewarding superior performance.

[0014] The system may allow for trading any combination of financial products. Initial pricing of  
20 the financial products may be based on the actual fair-market value of the financial products or based on the difference between real market prices and simulated market prices. In the alternative, new products may be created, tested, traded and studied within the closed  
25 simulated exchange. Orders may be placed and transactions may be filled based on the similar bid-ask system that governs real financial exchanges; that is buyers 'bid' prices and sellers 'ask' prices for specified financial products on the simulated exchange.  
30 A real trading screen or any screen could be provided in real time on the terminal in a window so the students could see how it is working in the real world. One could

10015739.121201

utilize informational pages, spreadsheets and other information tools and resources in the specified system and method.

10015739.121201  
[0015] Participants may include individuals competing  
5 against other individuals, groups of individual  
participants competing against other groups, a  
computerized specialist function interacting with at  
least one other participant, or any combination of groups  
and individuals competing against each other. An account  
10 may be assigned to each individual or group participant.  
The participants may compete among each other in a  
private, local community (such as participants within a  
classroom, academic department or college/school at a  
single university), or within a larger community (such as  
15 between groups at more than one university).

[0016] By simulating an interactive and real-time  
market for products, the present invention provides  
potential traders with a simulated trading environment  
similar to the environment of professional traders in  
20 real financial exchanges. This simulation improves the  
professional awareness of potential traders and heightens  
their understanding of the manner in which financial  
products and markets behave.

[0017] By providing them with such unequivocal  
25 experience, students who participate in the simulated  
training will be better prepared and more intellectually  
equipped to perform in live markets. In doing so, the  
system to eliminate a significant portion of the training  
and learning cost associated with trader development. It  
30 is the elimination of such costs, traditionally incurred  
by the new trader's employer, that represents value in  
implementing the present invention.

Brief Description of the Drawings

[0018] Further features of the invention, its nature and various advantages will become more apparent from the following detailed description of the invention, taken in  
5 conjunction with the accompanying drawings, in which like reference characters refer to like parts throughout, and in which:

[0019] FIG. 1 is a diagram of the information system architecture and configuration of hardware that may be  
10 used to implement the present invention;

[0020] FIG. 2 is an illustration of a full-screen GUI display that may be presented in accordance with one embodiment of the present invention;

[0021] FIG. 3 is a closer illustration of the trading  
15 window display shown in FIG. 2 that may be presented in accordance with one embodiment of the present invention;

[0022] FIG. 4 is a flow diagram illustrating the process for implementing one embodiment of the method and system specified by the present invention;

20 [0023] FIG. 5 is a Data Flow Diagram (DFD) of the information transacted during a simulated trade taking placing as specified by one embodiment of the system and method of the present invention.

[0024] FIG. 6 is a Process Flow Diagram illustrating a  
25 method to engage and employ the GUI to make transactions and participate in the simulated financial exchange as specified by one embodiment of the system and method of the present invention.

Detailed Description of the Invention

30 [0025] The present invention is now described in connection with FIGS. 1-6.

10015739 121201

[0026] Turning first to FIG. 1, an example of a systems architecture 100 that may be used to implement one embodiment of the present invention is shown. As illustrated, hardware 100 may include one or more local  
5 workstations 103 at a general location connected to one or more servers 102 (i.e. for intra-school competitions) and one or more workstations 113 and 123 at other participating schools connected to one or more local servers 112 and 122 (i.e. for interschool competitions)  
10 or any such means available that enables access to the simulated trading environment. Workstations 103, 113 and 123 may include any device suitable for presenting data and, in preferred embodiments of this invention, accepting input. For example, workstations 103, 113 and  
15 123 may be any combination of personal computers, laptop computers, mainframe computers, dumb terminals, data displays, Internet browsers, Personal Digital Assistants (PDAs), two-way pagers, wireless terminals, portable telephones, or any other form of networked personal  
20 computing device.

[0027] The trading simulator application software is installed on server(s) 102 to create a central repository of information within which the simulation may take place. Multiple wired and wireless connections 104 and  
25 105 may be made between server 102 and workstations 103 and between server 102 and other servers 112 and 122 via the Internet 150 to orchestrate the trading simulation among students using workstations 103, 113 and 123. Workstations 103, 113 and 123 submit and receive commands  
30 from server 102. In the case of workstations 113 and 123, gateway servers 112 and 122, or any applicable device, may be used to access and communicate with server

FOIA b 7 - D

102 via the Internet 150. In alternative embodiments, however, workstations 103, 113 and 123 may communicate with additional hardware and software, enable direct access via the Internet 150 using a centralized

5 Application Service Provider (ASP) or similar service, or may include hardware to orchestrate trading in a distributed fashion without requiring server 102. Server 102, and any additional servers, may consist of any suitable circuitry, devices or programs capable of  
10 processing data such as microprocessors, personal computers, network servers, mainframe computers, dedicated computer systems, etc.

[0028] As shown, server 102 may be connected to workstations 103, 113, or 123 either directly or via  
15 gateway servers 112 and 122, the Internet 150, or each of network devices 104, 105, 110 and 130, and may consist of any suitable data network for communicating data between workstations 103, 113 and 123, such as any combination of a local area network, a wide area network, the Internet,  
20 an intranet, a wireless network, a hard wired connection, a dial-up network, a virtual private network, or any available method of connecting multiple workstations.

[0029] When used to implement a bid/offer trading simulation for training traders within a single or across  
25 multiple networks as described above, hardware 100 may enable a participant to submit a bid to buy or offer to sell an item at one of workstations 103, 113 and 123. This bid or offer may then be communicated to server 102, where the bid or offer can be ranked and stored in a bid-  
30 offer queue. The ranking may be based upon time of submission, price, or any other suitable criterion. The bid or offer may then be presented to other traders via

10015739 \* 121201

other workstations 103, 113 and 123 dependent upon its ranking in the bid-offer queue. Once displayed, the bid or offer can then be hit or taken, respectively, by one or more of the other traders so that a trade of the item  
5 can proceed to execution.

[0030] FIG. 2 shows an example of a Graphical User Interface (GUI) 200 for presenting the functionality and information pertaining to the present invention and to be used by participants via workstations 103, 113 and 123.

10 As illustrated, simulated and actual financial information is presented via a financial information window 210 which may include charts, graphs, tables, spreadsheets or any medium of presenting detailed financial information about any particular financial  
15 product traded in the simulation. The financial information window 210 may include ticker symbol 211 or other means to properly identify the specified financial product, graph 212 relating price history, volatility, or any pertinent information regarding the financial  
20 product, table 213 containing current price, bid and ask quotes, daily volume and any other real-time decision making information as specified by a user, and footer 214 which may contain the bid-offer queue for the specified issue as well as the ability to access more detailed  
25 information about the company and/or financial product.

[0031] GUI 200 also includes an interactive trading window 220 (discussed in greater detail in FIG. 3) containing methods to 'Buy' 221 and 'Sell' 222 financial products. Each method consists of input fields that the  
30 user may complete as well as an execute function that the user may trigger to complete a transaction.

FIG. 2

10015739-121201

[0032] Also included in GUI 200 is a financial markets window 230 consisting of a table of real time news stories concerning financial markets which may include new stories, SEC filings, index quotes or any pertinent information as specified by the user. In accordance with the present invention, these portions of GUI 200 enable students to acquire trading finesse and sound trading judgement through the ability to assimilate and analyze real time financial information quickly for the purpose of making sound, assertive and responsible financial decisions based on dynamic, constantly-changing market conditions.

[0033] Turning to FIG. 3, an interface 300 is shown as one embodiment of the system used to submit buy and sell orders within the trading simulation in accordance with the present invention. To buy or sell a financial product in the training simulation the user may select the type of transaction they wish to complete 310, enter information in the number of shares to purchase field 311, enter a per share dollar value for the bid or offer limit in field 312, and execute the transaction, in the present embodiment by employing a device similar to 'Go' button 317. An order number 313 may then be issued by the system to track the order. When the order is filled, a time stamp, actual shares traded and price per share may fill fields 314, 315 and 316, respectively, and become part of the record associated with that order number. Interface 300 may be presented on a trader's workstation and information may be retrieved and/or inserted using any variety of input/output device.

[0034] Turning to FIG. 4, a process 400 for implementing the simulated trading environment in

accordance with one embodiment of the present invention is shown. As illustrated at step 401, process 400 first allows the administrators of the trading simulation to create accounts for each group or individual participant.

5 The accounts are then populated with an appropriate amount of funds to properly gauge the growth of the account over the specified time period. Funds may include cash, product, or any medium of exchange determined in step 402.

10 [0035] The next step 402 specifies that the participants adjust and/or customize the body of rules that govern financial transactions in the simulated trading environment. While each simulation may employ its own variation of the pre-programmed rules (as  
15 determined by all or selected participants), this customization may be performed centrally with any input/output device so that the same rules apply to all participants in the simulation.

[0036] Process 400 next specifies that each  
20 participant pay a fee for use of the trading simulation in step 403. This fee may be a fixed flat rate for participation, a fee-per-trade for each trade placed within the simulated exchange, or any method as specified by the participants in step 402. The fee may be paid for  
25 by a pre-determined body such as a university, corporate sponsor, or any benefactor.

[0037] In step 406, the registration fees may be pooled together and placed in a winners jackpot to be properly distributed at the conclusion of the trading  
30 simulation in step 407.

[0038] Process 400 then specifies for the trading simulation to take place in step 404. During a time

10015739-121201

period specified in step 402 participants may research, buy and sell products in a simulated trading environment. Products may include fixed income financial products such as treasuries, agencies, mortgages, swaps, REPOs,

5 corporates, etc. These instruments may initially be priced according to their real market value, according to a price pre-determined by the simulation's participants in step 402, or otherwise determined by participants of the simulation.

10 [0039] Once trading commences within the simulated exchange, products may be priced at the simulated market value, with buyers and sellers in the simulation specifying ask and bid limits to price the products. A more detailed example for processing bids and offers that  
15 may be executed in server 102 (FIG. 1) in accordance with one embodiment of the present invention is depicted in process 600 (FIG. 6).

[0040] Turning back to FIG. 4, process 400 next specifies the creation and testing of new financial  
20 products 405 in the simulated market based on the spread differentials and arbitrage opportunities that may arise from disparities between the simulated market and an actual market. Such products may behave as derivatives of the simulated market, offering participants an  
25 opportunity to learn how such products are traded in an open market and how their behavior may be gauged in relation to the base-market.

[0041] The final step of process 400, step 407, requires the dispersal of a financial reward to the  
30 winner of the simulation in step 404. The winner may be the group or individual participant with the highest account value at the end of the simulation, or any other

1005739-121201

method of determining the winner as specified in step 402. The declared winner may be awarded any amount of the fees allocated to the winner's jackpot in step 406 as determined by the participants in step 402.

5 [0042] Turning to FIG. 5, one embodiment of the flow of data and processes for implementing the present invention is shown in Data Flow Diagram (DFD) 500. DFD 500 specifies simulation 501 as the central process in the system, consisting of inputs from User Account Data 10 510 and 520, a Real Market Data Source 503 and simulated market data from Trades Data Store 530. User A 510 and User B 520, defined by records specified in Account Data Store 502, place orders via Buy 515 and Sell 525 processes depicted in DFD 500. The process for engaging 15 the GUI for the purpose of placing such trades is further depicted in process 600 (see FIG. 6). [0043] Turning back to FIG. 5, upon completing steps 510 and/or 515 of process 500, orders are placed in Trades Data Store 530. The bid/ask information is then relayed to the simulation 20 and can be viewed via the financial information window 210 depicted as part of GUI 200 (see FIG. 2).

[0044] Turning back to FIG. 5, once trades are accepted by matching the bid/ask with a respective ask/bid from counterparties participating in the 25 simulation, the orders are marked as filled from Trade Data Store 530 and removed from the queue. The user's account information is also updated with the transaction information in Account Data Store 502. Real-time information regarding most recent trades constantly 30 update the simulation to provide users with the look and feel of a dynamic and interactive trading environment.

100539-1201  
FOIA b 7 - D

10015739.12201

[0045] Turning to FIG. 6, one embodiment of a process that may be implemented for employing the GUI to engage the simulation is shown in Process Flow Diagram (PFD) 600. PFD 600 specifies that the user engage the trading simulation in step 601. Decision Point 602 then determines whether or not a trade may take place. If a trade does not take place, the user may continue to engage the system for the purpose of researching financial products and/or monitoring markets 608. If the user desires to place a trade, the user may complete the necessary fields of the transaction window 603. The user will then be prompted to determine the type of transaction by way of the buy or sell decision point 604. If the users elects for a sell transaction, a bid price must be furnished in the trading window in step 605. If the user elects a buy transaction, an ask price must be furnished in the trading window in step 606. When all appropriate information required by the trading window is furnished by the user, the trade is then executed in step 607. Once the trade is executed, the user may once again return to employing the GUI to engage the system for research 608 and trading 601 purposes.

[0046] Those skilled in the art will appreciate that the present invention can be practiced by other than the described embodiments, which are presented for purposes of illustration and not of limitation, and the present invention is limited only by the claims.
